

MTi Group celebrate the release of the new MiTiMEASURE tapes for dipping and quality assessment on mine sites. The NEW tape measures are more resilient than standard tapes, they won't knot or tangle, they are easier to read and quicker to use. Accurate and durable the MiTiMEASURE is the tape to choose

MiTiMEASURE

The NEW polychains are similar to the previous product made by Kinglon however they now also come in an imperial version. A coating of durable transparent PVC ensures that the numbers remain protected from the abrasion and chemicals encountered in Drill and Blast situations. The internal fibre core prevents the rope from stretching giving the user an accurate reading every time.

The **MiTiMEASURE** is lightweight and easy to handle, it doesn't knot and the high visibility green makes it easy to see. Labels are printed in black on a white background for excellent readability, previous reflective labels became hard to read in the sun but the non glare labels are great in all weather conditions. Every 10m label is colored differently for ease of identification and half meter increments are clearly numbered.

The **MiTiMEASURE** is an Australian made product of superior quality. The PVC coating is UV resistant so it won't crack after prolonged use.

PVC coated polyrope will slip easily along the ground and not tangle. When dipping wet holes the rope will slide along the walls of the hole and not catch on the way down. MTi group also stock a range weights to be used with the **MiTiMEASURE** all combining to make life on the bench a lot easier.

Guarantee

MTi GROUP are so confident with the **MiTiMEASURE** that they offer a full refund if the product does not perform.

Product Table

Item Number	Description
PL-030	30m MiTiMEASURE
